# Mechanical mounting and dismantling of rolling bearings

## Cylindrical bearing seats

In order to prevent bearing damage, the mounting forces must always be applied to the tightly fitted ring during mounting and dismantling. If the extraction forces are directed through the rolling elements during extraction of rolling bearings, the bearings are generally rendered unusable.

## Mounting

Smaller bearings can be driven cold onto the shaft or into the housing for normal tight fits.

For the economical and secure mounting of rolling bearings in the range up to 50 mm bore diameter and up to 110 mm outside diameter, mounting tool sets are suitable. They can also be used to easily mount sleeves, intermediate rings, seals and similar components, *Figure 1*.

Tightly fitted inner rings can be driven onto the shaft or outer rings can be driven into the housing bore by hitting a mounting sleeve with the hammer. Applying the mounting force to the tightly fitted bearing ring prevents the mounting forces from being transmitted through the rolling elements and raceways, which can lead to damage. The precision parts are matched to each other, ensuring that the forces are uniformly transmitted to the side faces of the bearing rings.

*Figure 1*  
Mounting tool set

## Dismounting

Extraction tools are used for dismantling. Particular care is also necessary during dismantling in order to prevent damage to the bearing. The extraction tool must always be applied to the ring to be removed.

For the dismantling of small bearings up to approx. 100 mm bore diameter that are located with a tight fit on the shaft or in the housing, mechanical extractors are used. The extraction force is normally applied by means of a threaded spindle, *Figure 2*. In the case of extractors for larger rolling bearings, the work can be aided by means of a hydraulic spindle. In this way, extraction forces of up to 400 kN (40 tonnes) can be generated.

*Figure 2*  
Two-arm extractor

### **Tapered bearing seats**

The inner ring of a bearing with a tapered bore is always mounted with a tight fit. The bearing can be seated directly on a tapered shaft or be located on a cylindrical shaft using an adapter sleeve or withdrawal sleeve. When the inner ring is pushed on, it is expanded and the radial internal clearance of the bearing is reduced.

The reduction in radial internal clearance is thus an indication of the seating of the inner ring. In order to prevent bearing damage, the inner ring must not be pushed on too far.

As an alternative to measurement of the radial internal clearance, the axial drive-up distance can also be measured in order to set the radial internal clearance correctly.

Locknuts can be easily tightened and loosened on shafts, adapter sleeves and withdrawal sleeves using sockets. Hook wrenches can be used to tighten and loosen locknuts and precision locknuts on shafts, adapter sleeves or withdrawal sleeves, *Figure 3*. If no tightening torque is specified, jointed hook wrenches and jointed pin wrenches can be used for locknuts and precision locknuts.

*Figure 3*  
Hook wrench

## Mechanical mounting and dismounting of rolling bearings

Double hook wrenches are engraved with a torsional angle scale. The radial internal clearance can thus be set precisely for self-aligning ball bearings and spherical roller bearings without the need for measurement, *Figure 4*.

*Figure 4*  
Double hook wrench

### FAG MOUNTING MANAGER

The online calculation program MOUNTING MANAGER is a user-friendly aid for ensuring the correct mounting of bearings with a tapered bore. It shows suitable mounting methods, calculates the data required for mounting in relation to the reduction in radial internal clearance and drive-up distance and generates a list of the accessories and tools required.

#### Further information

- Guide values for the reduction in radial internal clearance: Mounting Handbook MH 1, Mounting of Rolling Bearings
- Feeler gauges for measuring the radial internal clearance of rolling bearings: Catalogue IS 1, Mounting and Maintenance of Rolling Bearings
- Online calculation program FAG MOUNTING MANAGER: <http://mountingmanager.schaeffler.com>.

## Tools for mounting

Mounting tool set

# Mounting tool set FITTING-TOOL-ALU-10-50

## Features

The mounting tool set FITTING-TOOL-ALU-10-50 facilitates particularly economical mounting of many standardised rolling bearings and other parts with a cylindrical bore. It is suitable for rolling bearings with a bore diameter of 10 mm to 50 mm. Each mounting sleeve can be pushed over the shaft end by up to 220 mm.

The mounting rings are made from impact-resistant plastic. This prevents metal/metal contact as well as damage to or premature wear of the bearing seats. The mounting sleeves are made from aluminium. The head of the recoilless hammer produces no sparks.

The low mass of the components makes this mounting tool set very easy to handle. The parts are driven into place by hitting the mounting sleeve with the hammer, *Figure 1*.

*Figure 1*  
FITTING-TOOL-ALU

The combination of mounting ring and mounting sleeve required for a particular bearing is given in the dimension tables. This can also be taken from the worksheet included in the case for the mounting tool set.

It must be noted that, in some cases, the bearing can only be mounted in the housing while the shaft is dismantled. This is the case if the bore diameter of the bearing is larger than the inside diameter of the available mounting rings.

Scope of delivery

Scope of delivery of the mounting tool set FITTING-TOOL-ALU-10-50, *Figure 2*:

- 33 mounting rings
- 3 mounting sleeves
- 1 recoilless hammer
- 1 transport case.

The mounting rings, mounting sleeves and hammer can also be ordered as individual items. The dimensions of the transport case are 437 mm×379 mm×130 mm.

## Tools for mounting and dismounting

Sockets  
Hook wrenches  
Jointed hook wrenches  
Jointed pin wrenches  
Double hook wrenches

# Tools for mounting and dismounting

## **Sockets ..... 18**

Sockets LOCKNUT-SOCKET facilitate the tightening and loosening of locknuts with the aid of ratchets and torque wrenches. As a result, torque-controlled tightening is possible. A further advantage is that they require little space on the circumference of the nut.

---

## **Hook wrenches ..... 20**

Hook wrenches LOCKNUT-HOOK are suitable for the tightening and loosening of locknuts KM on shafts, adapter sleeves and withdrawal sleeves.

---

## **Jointed hook wrenches ..... 22**

Jointed hook wrenches LOCKNUT-FLEXIHOOK are suitable for the tightening and loosening of locknuts KM as well as precision locknuts ZM and ZMA on shafts, adapter sleeves and withdrawal sleeves. Due to the joint, a jointed hook wrench is suitable for a larger range of locknut sizes than a conventional hook wrench.

---

## **Jointed pin wrenches ..... 24**

Jointed pin wrenches LOCKNUT-FLEXIPIN are suitable for the tightening and loosening of precision locknuts AM, if no tightening torque is specified. Tightening is achieved by means of radially arranged holes.

---

## **Double hook wrenches ..... 26**

Double hook wrenches LOCKNUT-DOUBLEHOOK are suitable for the mounting of self-aligning ball bearings and spherical roller bearings with a tapered bore. They can be used to set the radial internal clearance of these bearings while tightening the locknuts without the need for measurement of the radial internal clearance or the axial drive-up distance.

# Sockets LOCKNUT-SOCKET

**Features** The sockets LOCKNUT-SOCKET, *Figure 1*, are suitable for the tightening and loosening of locknuts KM0 to KM20 on shafts as well as on adapter sleeves and withdrawal sleeves.

*Figure 1*  
Sockets LOCKNUT-SOCKET

The sockets require less space on the circumference of the nut than hook wrenches and allow the use of ratchets and torque wrenches, *Figure 2*.

For safer working, the sockets should be secured using a locking pin and rubber washer. The socket therefore has a hole for the locking pin and a groove for the rubber washer. The rubber washer prevents the locking pin from falling out. The locking pin and rubber washer are included in the scope of delivery.

*Figure 2*  
Use of the socket LOCKNUT-SOCKET

## Improved coating of the surface

The sockets LOCKNUT-SOCKET have a new type of coating. This coating replaces the black oxide coating that was previously used on these components. It has a lustrous silver colour.

The advantages of the coating are as follows:

- It is free from heavy metals and therefore environmentally acceptable.
- It gives improved anti-corrosion protection compared to black oxide coating.

LOCKNUT-SOCKET-KM24	130	170	76	110	80	18	1	4,15	KM24	ZMA90/115, ZM120

Sockets LOCKNUT-SOCKET are also suitable, in combination with sockets AMS, for precision locknuts AM.  
Further information: see TPI 123, Bearings for Screw Drives.

## Hook wrenches LOCKNUT-HOOK

**Features** The hook wrenches LOCKNUT-HOOK in accordance with DIN 1810-A are suitable for the tightening and loosening of locknuts KM on shafts, adapter sleeves and withdrawal sleeves, if no tightening torque is specified.

The hook wrenches are suitable for locknuts KM0 to KM40. Special sizes are available by agreement.

Hook wrenches can be used to mount rolling bearings on tapered shaft seats, on adapter sleeves and on withdrawal sleeves. Withdrawal sleeves can also be dismantled using hook wrenches together with the extraction nuts.

Hook wrenches can be ordered as individual items. The hook wrenches for the locknuts KM0 to KM16 are also available as a set with a roll-up pouch, *Figure 1*.

① Constituent part of **LOCKNUT-HOOK-KM0-16-SET**, mass m ≈ 2,01 kg.

## Jointed hook wrenches LOCKNUT-FLEXIHOOK

**Features** The jointed hook wrenches LOCKNUT-FLEXIHOOK, *Figure 1*, are suitable for the tightening and loosening of locknuts KM as well as precision locknuts ZM and ZMA on shafts, adapter sleeves and withdrawal sleeves, if no tightening torque is specified. The joint allows one hook wrench of series LOCKNUT-FLEXIHOOK to be used for mounting and dismounting locknuts of various sizes.

## Jointed pin wrenches LOCKNUT-FLEXIPIN

- Features** The jointed pin wrenches LOCKNUT-FLEXIPIN, *Figure 1*, are suitable for the tightening and loosening of precision locknuts AM15 to AM90 on shafts, if no tightening torque is specified. The jointed pin wrenches can be used to mount small bearings on tapered shaft seats. Tightening is achieved by means of radially arranged holes.

# Double hook wrenches LOCKNUT-DOUBLEHOOK

**Features** The double hook wrenches LOCKNUT-DOUBLEHOOK, *Figure 1*, are suitable for the mounting of self-aligning ball bearings and spherical roller bearings with a tapered bore. They can be used to set the radial internal clearance of these bearings precisely without the need for measurement of the radial internal clearance or the axial drive-up distance. Each double hook wrench is engraved with a torsional angle scale.

*Figure 1*  
Double hook wrench  
LOCKNUT-DOUBLEHOOK

Together with the double hook wrench, a torque wrench and mounting lever are required. For the torque wrench WRENCH20-100NM, which is used for locknuts from KM9, an adapter is also necessary, *Figure 2*. When the torque wrench is ordered, the adapter is included in the scope of delivery.

- ① Double hook wrench
- ② Torsional angle scale
- ③ Torque wrench
- ④ Adapter
- ⑤ Mounting lever

*Figure 2*  
Double hook wrench and  
accessories required

When using double hook wrenches, the first stage involves screwing the locknut into place as far as the initial mounting position. In order to determine this position exactly, a suitable torque wrench is necessary. The double hook wrench set includes a suitable wrench of this type.

In a second stage, the locknut is tightened with the aid of the torsional angle scale until the correct drive-up distance and thus the correct radial internal clearance of the bearing is achieved, *Figure 3*.

Information on the tightening torques and torsional angles for all suitable bearings is given in the user manual BA 28 included with the double hook wrench sets.

*Figure 3*  
Use of the double hook wrench  
LOCKNUT-DOUBLEHOOK

## Double hook wrenches LOCKNUT-DOUBLEHOOK

### Double hook wrench sets

The double hook wrenches can be ordered as individual items or in a set. There are 2 double hook wrench sets available.

#### LOCKNUT-DOUBLEHOOK-KM3-8-SET

The set LOCKNUT-DOUBLEHOOK-KM3-8-SET, *Figure 4*, comprises:

- 1 torque wrench:
  - LOCKNUT-DOUBLEHOOK.WRENCH10-50NM
- 6 double hook wrenches:
  - LOCKNUT-DOUBLEHOOK-KM3-D16
  - LOCKNUT-DOUBLEHOOK-KM4-D16
  - LOCKNUT-DOUBLEHOOK-KM5-D16
  - LOCKNUT-DOUBLEHOOK-KM6-D16
  - LOCKNUT-DOUBLEHOOK-KM7-D16
  - LOCKNUT-DOUBLEHOOK-KM8-D16
- 1 mounting lever:
  - LOCKNUT-DOUBLEHOOK.LEVER400
- 1 mounting paste:
  - ARCANOL-MOUNTINGPASTE-70G
- 1 transport case
- 1 user manual:
  - MATNR 032821409-0000.

*Figure 4*

LOCKNUT-DOUBLEHOOK-KM9-15-SET

The set LOCKNUT-DOUBLEHOOK-KM9-15-SET, *Figure 5*, comprises:

- 1 torque wrench with adapter:
  - LOCKNUT-DOUBLEHOOK.WRENCH20-100NM
  - LOCKNUT-DOUBLEHOOK.WRENCH-ADAPTER22-16
- 7 double hook wrenches:
  - LOCKNUT-DOUBLEHOOK-KM9-D22
  - LOCKNUT-DOUBLEHOOK-KM10-D22
  - LOCKNUT-DOUBLEHOOK-KM11-D22
  - LOCKNUT-DOUBLEHOOK-KM12-D22
  - LOCKNUT-DOUBLEHOOK-KM13-D22
  - LOCKNUT-DOUBLEHOOK-KM14-D22
  - LOCKNUT-DOUBLEHOOK-KM15-D22
- 1 mounting lever:
  - LOCKNUT-DOUBLEHOOK.LEVER400
- 1 mounting paste:
  - ARCANOL-MOUNTINGPASTE-70G
- 1 transport case
- 1 user manual:
  - MATNR 032821409-0000.

## Tools for dismounting

- Two-arm extractors
- Two-arm separator extractors
- Three-arm extractors
- Hydraulic pressure tool
- Hydraulic extractors
- Three-section extraction plates
- Internal extractors
- Special bearing extractors

# Tools for dismounting

## **Two-arm extractors** ..... 36

Two-arm extractors PULLER-2ARM are suitable for the extraction of rolling bearings or other tightly fitted components that can be gripped from the inside or outside.

---

## **Two-arm separator extractors** ..... 38

Two-arm separator extractors PULLER-2ARM-SEPARATOR are intended specifically for the extraction of bearing rings that are in full contact with a surface and do not have extraction slots.

---

## **Three-arm extractors** ..... 40

Three-arm extractors PULLER-3ARM are suitable for the extraction of rolling bearings or other tightly fitted components that have good axial and radial accessibility for gripping from the outside.

---

## **Hydraulic pressure tool** ..... 42

The hydraulic pressure tool PULLER-SUPPORT is used in conjunction with a mechanical extractor for the loosening of tightly fitted components.

---

## **Hydraulic extractors** ..... 45

Hydraulic extractors PULLER-HYD facilitate the extraction even of larger rolling bearings. The extraction forces are applied by means of a hydraulic cylinder.

---

## **Three-section extraction plates** ..... 52

Three-section extraction plates PULLER-TRISECTION are used in conjunction with a three-arm extractor for rolling bearings or inner rings.

---

## **Internal extractors** ..... 54

Internal extractors PULLER-BORE are suitable for the dismounting of deep groove and angular contact ball bearings with a tightly fitted outer ring. In this case, the inner ring bore must be freely accessible.

---

## ..... 58

Internal extractors PULLER-INTERNAL are suitable for the dismounting of deep groove and angular contact ball bearings with a tightly fitted outer ring without the need for dismounting of the shaft.

---

## **Special bearing extractors** ..... 61

Special bearing extractors PULLER-SPECIAL are used for the dismounting of radial bearings with a tight fit of the inner ring or outer ring under difficult conditions.

## Two-arm extractors PULLER-2ARM

**Features** The two-arm extractors PULLER-2ARM, *Figure 1*, are suitable for the extraction of complete rolling bearings of widely varying types, of tightly fitted inner rings and of other components such as gears that can be gripped from the inside or the outside. These extractors require good radial and axial accessibility of the bearing position, possibly with extraction slots.

*Figure 1*  
Two-arm extractor PULLER-2ARM

The grip span is adjusted by moving the arms on the crossbar. Symmetrical adjustment is aided by a scale. During extraction, a self-locking device prevents the arms from slipping off. A rotatable insert in the spindle facilitates selection of either a pointed or round centring tip.

- PULLER-2ARM-SET The PULLER-2ARM-SET, *Figure 2*, comprises:
- 1 two-arm extractor PULLER-2ARM130
  - 1 two-arm extractor PULLER-2ARM200
  - 1 two-arm extractor PULLER-2ARM350
  - narrow extraction arms of size 130 and 200
  - 1 tube of spindle grease
  - 1 transport case.

*Figure 2*  
PULLER-2ARM-SET

# Two-arm extractors

① Constituent part of **PULLER-2ARM-SET**, mass  $m \approx 15,5$  kg.

## Two-arm separator extractors PULLER-2ARM-SEPARATOR

**Features** The two-arm separator extractors PULLER-2ARM-SEPARATOR, *Figure 1*, are suitable for the extraction of complete rolling bearings or tightly fitted inner rings. Bearing rings can be in full contact with a surface, i.e. extraction slots are not necessary.

*Figure 1*  
Two-arm separator extractors  
PULLER-2ARM-SEPARATOR

The separator extractor of suitable dimensions is selected in accordance with the bearing size and the mounting conditions, *Figure 2*.

Once the separator extractor has been positioned, the screw on the clamp is rotated in order to slide the arms between the bearing ring and the locating face. This is aided by means of a special profile on the arms. Once the bearing has been wedged in this way, it is then extracted by rotating the spindle.

The wedging of the bearing, in conjunction with centring on the shaft, allows gentle extraction of the bearing.

*Figure 2*  
Use of the two-arm separator  
extractor PULLER-2ARM-SEPARATOR

## Three-arm extractors PULLER-3ARM

**Features** The three-arm extractors PULLER-3ARM, *Figure 1*, are suitable for the extraction of complete rolling bearings of widely varying types and of tightly fitted inner rings. These extractors require good radial and axial accessibility of the bearing position, possibly with extraction slots.

*Figure 1*  
Three-arm extractor  
PULLER-3ARM

The grip width is set by rotating the knurled disc located above the upper screw. This disc is connected to an adjustment cylinder that has two opposing threads. Due to this arrangement, the two screws rotate simultaneously, which means that the entire grip width can be covered in just a few revolutions. The arms always move symmetrically to the centre, which aids operation under unfavourable conditions. Since the arms are screw mounted, they can be reversed and operation as an internal extractor is possible.

The extractor of suitable dimensions is selected in accordance with the bearing size and the mounting conditions, *Figure 2*. The self-centring function prevents tilting of the bearing during tightening.

*Figure 2*

# Hydraulic pressure tool PULLER-SUPPORT

**Features** The hydraulic pressure tool PULLER-SUPPORT, *Figure 1*, is used for the loosening of tightly fitted parts in conjunction with mechanical extractors.

Depending on the size, it generates an axial force of 80 kN or 150 kN. The spindle thread of the mechanical extraction tool is not unduly stressed as the main extraction force acts on static thread flanks.

*Figure 1*  
Hydraulic pressure tool  
PULLER-SUPPORT150

The hydraulic pressure tool is positioned between the spindle of the extractor and the end of the shaft. The spindle of the extractor must be in contact with the pressure tool, *Figure 2*. The hydraulic system is actuated by screwing in the pressure screw, *Figure 3*. The axial force generated in this way loosens the component to be extracted. The component can then be extracted using the mechanical spindle of the extractor.

*Figure 2*  
Hydraulic pressure tool  
in combination  
with two-arm extractor

*Figure 3*  
Use of the hydraulic pressure  
tool PULLER-SUPPORT

000852E7

The pressure tool PULLER-SUPPORT150 has a hydraulic return mechanism. This means that, when the pressure screw is reversed, the hydraulic piston automatically returns to the initial position.

For safety reasons, the minimum size of spindle diameter and the maximum torque must be observed, see dimension table.

<b>PULLER-SUPPORT150</b>	150	10	85	M30	50	1,7

# Hydraulic extractors PULLER-HYD

## Features

The hydraulic extractors PULLER-HYD are available with extraction forces of 40 kN to 400 kN. They facilitate simple dismantling of rolling bearings, gears, bushes and other components. Depending on the size, the hydraulic cylinders of the extractors have an integrated or a separate hydraulic hand pump. Due to the rotatable pump lever of the integrated hand pump, the operator can always adopt the optimum working position.

The stroke length can be adjusted by means of the adapter included in the scope of delivery. If there is insufficient space for 3 arms, the extractor can be simply converted to 2 arms.

The parts of the extractor under mechanical load are made from high quality chromium-molybdenum steel. The smooth-running piston is made from quenched and tempered steel with a chromium coating.

*Figure 1*  
Use of the hydraulic extractor  
PULLER-HYD in conjunction  
with the three-section extraction  
plate PULLER-TRISECTION

The application example, *Figure 1*, shows the positioning of the extractor on the bearing. Before the bearing is extracted, the safety grid or safety cover must be put in place.

## Hydraulic extractors PULLER-HYD

### Scope of delivery

When a hydraulic extractor PULLER-HYD is ordered, the extractor is supplied with the following accessories:

- 1 adapter in the case of extractors with arms of normal length, 2 adapters in the case of extractors with extended arms
- hydraulic cylinder with integrated or separate hydraulic pump, depending on design
- arms of normal length or extended arms, depending on design
- safety grid or safety cover, depending on size
- plastic or metal case, depending on size.

If replacement parts for these components or arms of a different length are required, these can also be ordered as individual items.

### PULLER-HYD40 to PULLER-HYD80

The hydraulic extractors with cylinders with an integrated hand pump PULLER-HYD40, 60 and 80 are available for extraction forces of 40 kN, 60 kN and 80 kN, *Figure 2*.

The compact units are housed in a robust plastic case. For the protection of operating personnel, a safety grid is included.

The hydraulic extractors PULLER-HYD40 are supplied with arms of normal length. The hydraulic extractors PULLER-HYD60 and PULLER-HYD80 are also available in a version with extended arms, suffix XL.

*Figure 2*

Hydraulic extractor with integrated hand pump PULLER-HYD80

0009673C

**PULLER-HYD100 to  
PULLER-HYD300**

The hydraulic extractors with cylinders with an integrated hand pump PULLER-HYD100, 120, 200, 250 and 300 are available for extraction forces of 100 kN to 300 kN, *Figure 3*.

The compact units are housed in a rigid metal case. For the protection of operating personnel, a safety cover is included. The hydraulic extractors PULLER-HYD100 to PULLER-HYD300 are also available in a version with extended arms, suffix XL.

*Figure 3*  
Hydraulic extractor with integrated  
hand pump PULLER-HYD100

**PULLER-HYD400**

In the case of the hydraulic extractor PULLER-HYD400 for an extraction force of 400 kN, the oil pressure is applied by means of a separate hand pump. The extractor can be therefore also be used where space is restricted.

The extractor is housed together with the pump in a rigid metal case, *Figure 4*. For the protection of operating personnel, a safety cover is included.

The hydraulic extractor PULLER-HYD400 is also available in a version with extended arms, suffix XL.

## Three-section extraction plates PULLER-TRISECTION

**Features** The three-section extraction plates PULLER-TRISECTION, *Figure 1*, are used for the extraction of complete bearings or tightly fitted inner rings.

*Figure 1*  
Three-section  
extraction plate PULLER-TRISECTION

The extraction plates are mainly suitable for mounting situations where a three-arm extractor on its own cannot be used to achieve gentle extraction by means of the inner ring. This can be the case, for example, where there are no extraction slots or the bearing rings are wide, if the arms cannot grip the inner ring.

Good radial access to the bearing position is required. Extraction of inner rings and complete rolling bearings without damage is possible with proper handling.

The three extraction plates are pushed, by means of alternately screwing in the nuts, between the shaft shoulder and inner ring. The bearing is extracted by means of an extractor that is inserted into the plates, *Figure 2*.

*Figure 2*

## Internal extractors PULLER-BORE

**Features** The internal extractors PULLER-BORE are suitable for the dismantling of deep groove and angular contact ball bearings with a tightly fitted outer ring. In this case, the inner ring bore must be freely accessible. The internal extractors can be used for bearings with bore diameters of 5 mm to 79,5 mm. Since the extraction force is directed through the rolling elements, the possibility of bearing damage cannot be excluded.

The gripping segments of the internal extractor are spread when the threaded spindle is tightened. The lip of the gripping segments is pressed against the back of the bearing inner ring bore.

The bearing is then extracted with the aid of the countersupport and its threaded spindle, *Figure 1*.

*Figure 1*  
Internal extractor PULLER-BORE  
with countersupport

As an alternative to the countersupport, an impact extractor comprising a rod and an impact weight can be used. The internal extractor is screwed onto the rod. The bearing is then dismantled by applying impacts to the rear end of the impact extractor by means of the impact weight, *Figure 2*.

*Figure 2*  
Internal extractor PULLER-BORE  
with impact extractor

**Internal extractor sets** The internal extractors can be ordered as individual items or in a set. There are 2 internal extractor sets available.

**PULLER-BORE5-39-SET** The internal extractor set PULLER-BORE5-39-SET, *Figure 3*, comprises:

- 1 countersupport
  - PULLER-BORE.HOLDER-30-95
- 1 impact extractor
  - PULLER-BORE.IMPACT-90
- 6 internal extractors
  - PULLER-BORE.GRIPPER-5-6

# Special bearing extractors PULLER-SPECIAL

## Features

The special bearing extractors PULLER-SPECIAL, *Figure 1*, are used for the dismantling of radial bearings with a tight fit of the inner ring or outer ring. They are required if the bearing rings cannot be gripped using conventional extractors. They are also suitable for cases where the inner ring is in contact with a shaft shoulder that does not have extraction slots. This also applies if the bearing in a housing must be removed from the shaft.

The special bearing extractors comprise a base device and a collet. Extraction of the bearing without damage is possible with proper handling. The maximum shaft diameter is 75 mm.

*Figure 1*  
Special bearing extractor  
PULLER-SPECIAL

A differentiation is made between 4 extraction principles, see page 64. The extraction principle depends on the bearing design and the mounting position. The collet grips the bearing ring by the maximum possible circumferential surface.

Depending on the extraction principle, the finger-shaped extensions of the collet engage between the rolling elements on the raceway edge of the inner ring, behind the rollers in tapered roller bearings or by wedging behind the chamfer of the bearing ring to be extracted.

## Special bearing extractors PULLER-SPECIAL

For use, a collet is screwed into the base device and positioned on the bearing, *Figure 2*. The collet is closed using the left hand thread of the union nut and clamped against one of the bearing rings, *Figure 3*. The extraction force is generated by a threaded spindle, *Figure 4*.

*Figure 2*  
PULLER-SPECIAL:  
positioning on the bearing

*Figure 3*  
PULLER-SPECIAL:  
tensioning of the collet  
on the bearing

*Figure 4*  
PULLER-SPECIAL:  
extraction of the bearing

## Selecting the special bearing extractor

When selecting the base device and collet, the size of the bearing and the extraction principle necessary for the application must be taken into consideration.

### Base device

The base device is selected so that its inside diameter  $d$  is larger than the bore diameter of the bearing. For the deep groove ball bearing 6015 (bore diameter = 75 mm), for example, the base device PULLER-SPECIAL-BASIC77 ( $d = 77$  mm) must be selected.

For applications in which the bearing must be pushed a particularly long distance onto the shaft, extensions are available for the base devices, *Figure 5*.

- ① Base device
- ② Base device with extension

*Figure 5*  
PULLER-SPECIAL  
with tapered roller bearing

### Collet

The gripping profile of collets must be matched to the geometry of the bearing to be extracted. The extraction principle and thus the collet depends on the bearing design and the mounting position. Two collets are always required for tapered roller bearings in X and O arrangements.

Since the number of rolling elements is not standardised, different collets may be required for the same bearing sizes from different manufacturers. The bearing manufacturer must always be stated at the time of ordering.

### Ordering designation

The ordering designation of a collet comprises:

- PULLER-SPECIAL
- the extraction principle
- the bearing designation.

Example: PULLER-SPECIAL-A-6208.

## Special bearing extractors PULLER-SPECIAL

### Extraction principles

The extraction principle depends on the bearing design and the mounting situation, *Figure 6* to *Figure 9*. In the case of tapered roller bearings arranged in pairs in an X and O arrangement, the extraction principle B is used for one bearing and the extraction principle C for the other bearing.

#### Extraction principle A

The extraction principle A is used for deep groove, angular contact and self-aligning ball bearings, four point contact bearings, ball bearings with a split inner ring and roller bearings. For extraction, the inner ring of the bearing is gripped. Extraction is therefore also possible if the bearing is located in the housing in such a way that the bearing cannot be gripped either from the inside or from the outside.

This extraction principle can also be used to grip bearings that are located deep in a housing if the outside diameter of the bearing is greater than the outside diameter of the base device.

*Figure 6*  
Extraction principle A

#### Extraction principle B

The extraction principle B is used for tapered roller bearings mounted in an X or O arrangement. The gripper reaches over the rollers, irrespective of their number. The internal profile of the collet is matched to the rollers and their angle.

With certain bearing dimensions, deeply located bearings can also be extracted. The outer ring must be removed in advance.

*Figure 7*  
Extraction principle B

### Extraction principle C

The extraction principle C is used for tapered roller bearings mounted in an X or O arrangement. The collet engages behind the large rib of the inner ring. The possibility of gripping behind is predetermined by the bearing geometry and is normally small, which requires high precision in the manufacture of the collets.

The outer ring must be removed in advance.

Figure 8

Extraction principle C

### Extraction principle D

The extraction principle D is used for a wide variety of bearing types. Examples include the inner rings of cylindrical roller bearings, angular contact ball bearings and magneto bearings, the second inner ring half of four point contact bearings and the outer rings of deep groove ball bearings, spherical roller bearings and needle roller bearings. Other components such as ABS rings or gears can also be extracted using extraction principle D.

In the extraction of rolling bearings, wedging of the rolling bearing is carried out on the chamfer of the bearing ring.

Extraction principle D

Ordering example for special bearing extractor and collet for cylindrical roller bearing NU315:

### Ordering example

Tool	Ordering designation
Base device	PULLER-SPECIAL-BASIC77
Collet	PULLER-SPECIAL-D-NU315

## Special bearing extractors PULLER-SPECIAL

### Special tools

In addition to the special bearing extractors with base device and collet, other designs are available. These are available by agreement.

#### PULLER-SPECIAL-CUSTOM

Larger extraction collets do not include the base device. In this case, the collet is tensioned by means of a locking collar and the bearing is extracted from the shaft by means of a hydraulic cylinder, *Figure 10*. Extractors of the type are manufactured by agreement as a customer-specific solution.

*Figure 10*  
Special bearing extractor  
PULLER-SPECIAL-CUSTOM

#### PULLER-SPECIAL-E

The extractor PULLER-SPECIAL-E is a tool for the dismantling of spherical roller bearings and toroidal roller bearings, *Figure 11*. The dismantling tool has specially produced fingers that grip behind the end faces of the rollers. The extractor then presses on the shaft by means of a hydraulic cylinder and pulls the bearing out. The tight fit of the bearing inner ring must have been removed in advance, for example by the use of a hydraulic system for the oil pressure method.

The most frequent application for the extractor PULLER-SPECIAL-E is found in paper machinery.
